1. Peers recommended us to use a bar chart instead of a bubble chart with Y-axis being # of states and X-axis being house price. Unni advised us using use real population data instead of state size ranks to set color and radius of circles in the chart. Peers think bubbles would be overlapped with each other. They suggested us should have option buttons in order to allows users to select:
 - a. Top 10 highest price
 - b. Top 10 lowest price
 - c. Top 10 population

Response: We believe bubbles would be fine because X-axis has enough spaces to display 50 states. After implementing, we realize that we were right. In addition, we had still looked for population data set from 1996-2016 so that we planned to set xScale based on size ranks. Therefore, bubbles would not be overlapped but we will think of adding option buttons to let our visualization much more interaction and easy to explore.

2. Add legends to line charts and bubble chart

Response: They are supposed to be there, just not in our sketches.

3. Peers suggested to use the chart in GapMinder for our line charts instead.

Response: We think that is good suggestion. We will discuss and then decide if it's suitable for our visualization.

4. In the individual cards at the bottom, think about adding a bar chart or the chart in <https://www.oecdregionalwellbeing.org/> to compare against other states.

Response: OECD regional well-being is very good visualization. We had a chance discussing in class. We will consider it as an optional feature and thank for great suggestion.

5. Implementing tooltip to show highest and lowest rent/house price in history for that state.

Response: adding tooltips came to our mind when we're working on proposal but we didn't mention in final design. Thanks for reminding us.
